GO! Connect combines the GO! logistics solutions with the GO! customers' shipping systems. In this way, consignment ordering and tracking can be made even more efficient in the future and consignment data can be retrieved more quickly. Due to the modular structure of GO! Connect, companies can individually expand their processes by integrating relevant data.

While previous interface connections relied on FTP or SOAP-based XML formats, among others, the new GO! Connect modules can now also be used as modern REST-based API connections. In this way, the applications can be implemented in customers' systems independently of their IT interfaces.

The GO! Connect modules are categorised as Order Management with all relevant applications for order placement and Tracking Solutions with all applications related to shipment tracking.

In addition to the Shipment Tracker, our customers can also use the Shipment Report and Real-time Order & Label modules.

The advantages of the GO! Connect Shipment Tracker at a glance

- retrieve the status data of a shipment with the GO! waybill number (tracking number)
- current information on transport congestion and location in different languages
- detailed information (status code, description, time, location) of all available scans and status information
- overview of the GO! stations and places touched in chronological order
- integration of all data into the customers' systems via modern API
- languages offered: Czech, Danish, Dutch, English, French, German, Italian, Polish, Slovak
