

GO! Connect Shipment Report

GO! Connect connects the GO! logistics solutions with the shipping systems of GO! customers. In this way, consignment booking and tracking can be made even more efficient in the future and consignment data can be retrieved more quickly.

Due to the modular structure of the GO! Connect web services, companies can individually expand their processes by integrating relevant data.

The modules of GO! Connect are divided into the categories **Order Management** – with all relevant applications for placing orders – and **Tracking Solutions** – with all applications related to the topic of shipment tracking. In addition to the Shipment Report, customers can also use the Shipment Tracker and Realtime Order & Label modules.

For the Shipment Report, this means modern, highly available REST-based API connections for integration into your software solution. After programming on your part, you can – with the help of the transmitted data – create individual shipment overviews and a variety of sorting and filtering options.

The advantages of the GO! Connect Shipment Report at a glance

- high reliability and availability of the interface via cloud architecture
- broadcast overview retrievable via modern REST-based API technology
- provision of all important shipment details up to the current transport status
- after integration and configuration in your system: numerous sorting and filtering options up to the creation of your own courier transfer lists
- can be used/integrated independently of the operating system and software used
- available free of charge for GO! customers
- free support and advice on questions about our GO! web services
- continuous optimisation and further development
